Assignment 2: Calculating the Area of a Triangle

1- Create a Java project and let the *class wizard* create a class called `Triangle` that contains a main method.
2- Perform the following in the main() method:
   a- Define the lengths of the three sides of the triangle (a, b, and c) as double values.
   b- If any of the values for the sides is negative, make sure to display a message:
   "Invalid Side values"

   c- Use **Heron's formula** for finding the area of a scalene triangle, that is:

$$area = \sqrt{s(s-a)(s-b)(s-c)}$$

   Where s is the semi-perimeter and defined as:

$$s = (a + b + c) / 2$$

[Hint. The square root function is Math.*sqrt()*].

   d- Display a message to the user showing the side lengths and the calculated area in a clear format.

3- Submit the .Java file Triangle class.
