Classes Assignment:

Create a class called Employee that includes three pieces of information as instance variables:

- firstName (type String)
- lastName (type String)
- monthlySalary (type double)

In addition, add one static variable called raisePercentage (type double) that stores the current raise rate (for example, 10.0 for a 10% raise).

Your class should include:

1. A constructor that initializes the three instance variables.
2. A set and get method for each instance variable.
3. A static method called setRaisePercentage(double newRaise) that updates the raise percentage for all employees.
4. A method named getYearlySalary() that returns the yearly salary.
5. A method named applyRaise() that increases the salary based on the static raisePercentage.
6. If the monthly salary is not positive, set it to 0.0.

Then, write a test application named EmployeeTest that demonstrates the class's capabilities.

Steps in EmployeeTest:

1. Create two Employee objects and display the yearly salary for each.
2. Use the static method to set the raise percentage to 10.0.
3. Apply the raise for each employee.
4. Display the new yearly salaries.

Sample Output:

Employee 1: Mike Jones; Yearly Salary: 34500.00

Employee 2: Suzan Bob; Yearly Salary: 37809.00

Increasing employee salaries by 10%

Employee 1: Mike Jones; Yearly Salary: 37950.00

Employee 2: Suzan Bob; Yearly Salary: 41589.90
